

Reflection Report

Reflection on Week 1: Business Understanding & Data Exploration

This project was my first assignment as a Data Science intern at AnalystLab Africa.

To be honest , I have worked on many projects in data analysis and data science. But what I was missing, the thing I learned through this task, is how to understand the business, how to ask the right questions , and then how to find answers to these questions.

My approach to this problem taught me a lot . Starting with understanding what employee attrition is, how much impact it can have on the company budget, and how we as data scientists can help to let the one in charge see the exact problem.

Another important thing I learned is how important data exploration is. While doing EDA, I noticed a lot of patterns in the data.

Outliers , mean , std , max , min , frequency and so.

These are basic statistics numbers that give you the whole idea about your data.

The data is from kaggle so it was super clean. I usually spend like a whole day doing data cleaning but thank God that wasn't the case 😊.

Something that I struggled with was finding the best visualization for each question. Should I go with boxplots or another graph to see whether the age has an impact on a person's decision to leave the company? I am glad I could figure this out.

I learned that every graph should tell a meaningful story and provide insights that can help the business make better decisions.

I am super grateful for this opportunity that seems to be teaching me a lot. I am still learning and growing.

In future projects, I would like to perform more advanced statistical analysis and build predictive machine learning models to identify employees who may be at risk of leaving. I look forward to applying the knowledge gained from this assignment to more complex real-world business problems throughout my internship.

Thank you AnalystLab Africa
